Survey 1619H – Part One (1619Ha)

### REPORT

15 July - 21 July 2019

| Loading:   | Aultbea, 14 July 2019 |
|------------|-----------------------|
| Boarding:  | Aultbea, 15 July 2019 |
| Unloading: | Aultbea, 21 July 2019 |

In setting the survey programme and specific objectives, etc the Scientist-in-Charge needs to be aware of the restrictions on working hours and the need to build in adequate rest days and rest breaks as set out in Marine Scotland's Working Time Policy (Lab Notice 34/03). In addition, the Scientist-in-Charge must formally review the risk assessments for the survey with staff on-board before work is commenced.

In the interest of efficient data management it is now mandatory to return the survey report, to I Gibb and the Survey Summary Report (old ROSCOP form) to M Geldart, within four weeks of a survey ending. In the case of the Survey Summary Report a nil return is required, if appropriate.

Project: 7 days, SP02R0 (20490)

### Sampling Gear & Equipment

Fish traps (6 fleets of 2 traps)

2 Stereo Baited Remote Underwater Video Camera (SBRUV) frames (BUC1 & BUC2)

4 LED light assemblies in GPH housing

4 SJCAM SJ6 Legend HD action cameras and custom-built acetylene housings

### Overview

Cruise 1619Ha was designed to provide additional data on the habitat associations of juvenile cod, haddock, whiting and saithe in the period following settlement.

### Objectives

1. To deploy fish traps over various habitat types within Loch Ewe.

2. To synchronously deploy baited remote underwater video camera frames fitted with twin cameras calibrated for post-survey analysis.

# Narrative

Scientific equipment was loaded onto the *Walrus* on the evening of 14 July. Staff boarded the following morning and the vessel departed immediately.

SBRUV frames and fish traps baited with approximately 500 g of defrosted mackerel and crushed crabs were deployed at stations LE\_05 and LE\_30 (see Fig. 1). The remaining fleets were deployed further to the north, towards the mouth of the loch, along the western side and to the north-west of the Isle of Ewe. Footage of the seabed was captured using a small hand-held drop frame in order to classify substrate and habitat type post-survey. Start and end waypoints and sounder depth were recorded each time a fleet was deployed.

The stereo-camera moorings were recovered, rebaited and redeployed. Micro SD cards from each camera were downloaded to external media at the end of each working day.

*Walrus* worked around the loch over the next six days and was able to successfully survey every fish trap and SBRUV station. Traps and baited frames were safely and efficiently deployed from the stern of the boat and recovered using a davit system and electric motor. This new approach allowed the operator to carefully control how the static gear was handled and moved and significantly improved deck safety. Similarly, traps can now be easily closed and secured using elasticated cord and a hook, further streamlining this survey method.

Attempts to gather baitfish were reasonably productive and enough mackerel were caught to provide for the entire charter. Crabs caught in the traps were used as bait the following day.

Unloading occurred in Aultbea on the evening of 21 July and scientific staff returned to Aberdeen the following morning.

### Results

### Fish Trap Survey

Fleets were deployed during daylight hours and were left for between 4 hours 44 minutes and 6 hours 38 minutes, averaging 6 hours and 11 minutes per deployment. **Table 1** gives trap fleet mid-point latitude and longitude (degree decimal), average depth in metres and soak-times of each deployment – mid-points are plotted in **Figure 1**.

Table 1: Spatial (fleet mid-points) and attribute data of fish trap deployments. Latitude and longitude in degree decimal format.

Frozen fish samples were transported back to the lab and will be processed at a later date. **Table 2** gives a breakdown of invertebrate and fish species catch frequencies by trap.

Stereo Baited Remote Underwater Video (SBRUV) Survey

The SBRUV frames were deployed in depths ranging from 4.5 to 32.5 m, capturing a combined total of 54 hours 55 minutes worth of high definition footage. Video was recorded in 1920 by 1080p resolution, at 60 frames per second. Deployment coordinates, depth, start time and duration are summarised in **table 3**. Video files were edited for extraneous footage and will be analysed at a later date.

Fig. 1 shows the positions of each SBRUV deployment within the loch.

## Conclusion

The charter was very successful with all stereo camera and fish trap stations surveyed. MSS staff would like to thank the skipper and crew of the *Walrus* for their continued cooperation, patience, and willingness to provide useful advice and guidance.
